## Basic building blocks of a space: simplices

## Simplicial Neural Networks

### Laplacians for simplicial complexes

The graph Laplacian can be extended to Laplacians for simplices of any dimension  $k$  [1]. The  $k$ -Laplacian can be interpreted as a function propagating values of functions on the  $k$ -simplices. These functions are called  $k$ -cochains,  $x_k$ .

$L_0$ : Graph Laplacian  
 $y_0 = L_0 x_0$

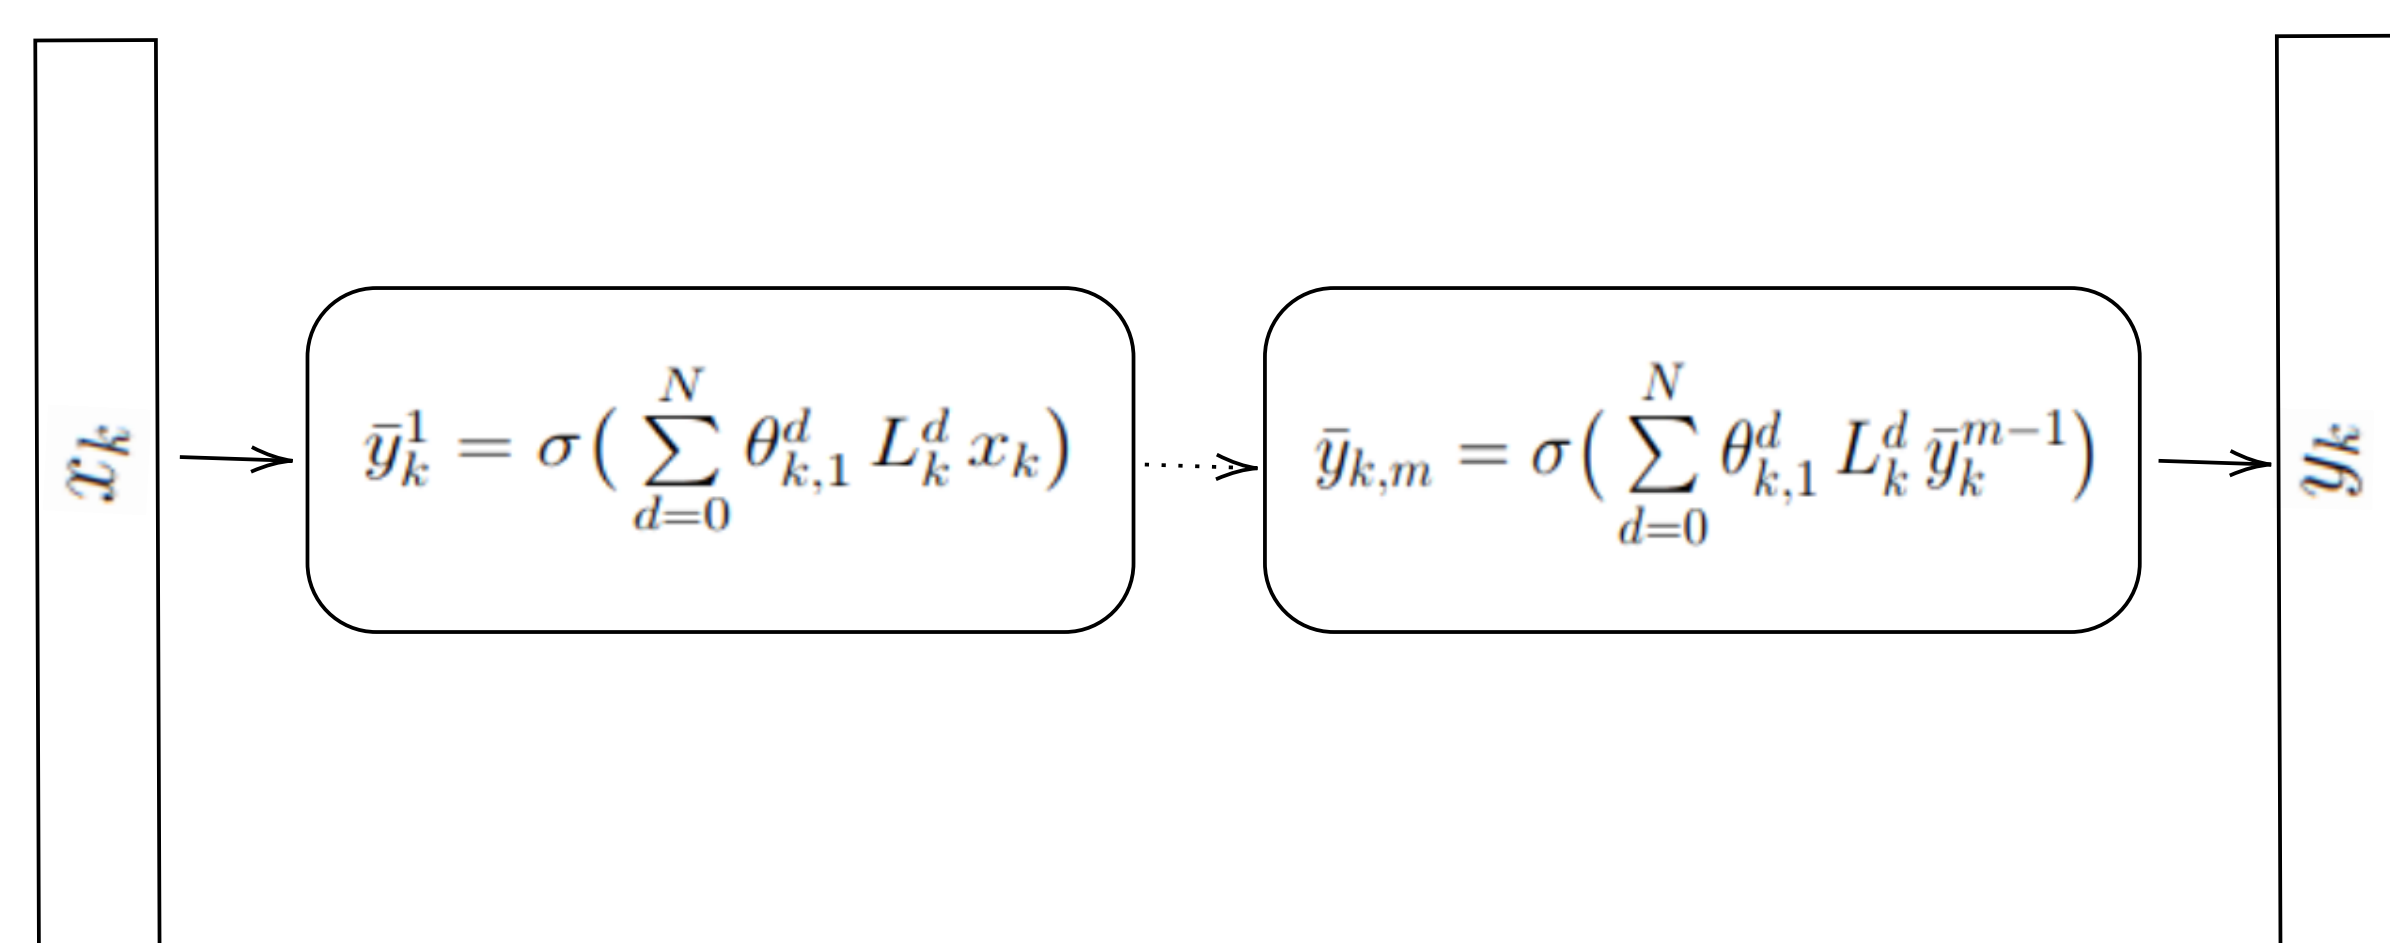

$L_1$ : 1-Laplacian  
 $y_1 = L_1 x_1$

$L_2$ : 2-Laplacian  
 $y_2 = L_2 x_2$

### Simplicial Neural Networks (SNNs)

- The convolutional filters are low-degree polynomials in the Laplacian with learnable coefficients.
- The input are multiple  $k$ -cochains on the  $k$ -simplices,  $W_k$ .

- Convolution can be implemented by  $N$  sparse matrix-vector multiplications: the computational cost is  $\mathcal{O}(\xi|W_k|)$ .
- The number of weights to be learned is reduced from  $\mathcal{O}(|W_k|)$  to  $\mathcal{O}(1)$ .
- The operation is  $N$ -localizing: if two simplices are more than  $N$  hops apart, there is no interaction between them.

## Coauthorship complex: from a bipartite graph to a complex

## Imputing missing citations on the coauthorship complex

### Data

Coauthorship complexes were built from the Semantic Scholar dataset [2] where missing citations are introduced at random on the  $k$ -cochains ( $k = 1, 2, 3$ ) at four rates: 10%, 20%, 30%, and 50%.

### First Results

Mean accuracy  $\pm$  standard deviation over 5 samples in imputing missing citations.

Performance of baselines: mean accuracy  $\pm$  standard deviation over 5 samples for 30% missing citations.

Method	Dimension 0	Dimension 1	Dimension 2
Global Mean	$3.30 \pm 0.82$	$5.75 \pm 1.28$	$2.96 \pm 0.49$
Global Median	$7.78 \pm 2.70$	$10.44 \pm 1.00$	$12.50 \pm 0.63$
Neighbors Mean	$11.88 \pm 5.29$	$24.15 \pm 1.85$	$27.38 \pm 1.18$
